Excerpt from On Railroad Injuries of the Extremities of the Human Body: With Observations on the Site of Amputation and Subsequent Treatment of the Stump In some cases it has been observed that the muscles slough to a much greater extent than the skin, giving the stump a cupped appearance, with the bone projecting from the centre; the whole resembling an old fashioned candlestick. Since the introduction of anaesthetics, shock from operation has been reduced to a minimum, and therefore-the removal of a few more inches of the limb, is of very little consequence so far as the safety of the individual is concerned and the perfection reached in the adaptation of artificial limbs amply compensates for the increased shortening. All these considerations should outweigh the risks of amputation in the immediate proximity of the injury. 2022 As more internists and family physicians increase their scope to include sports medicine, this book reaches beyond the orthopaedic surgery market to provide a one-source reference for the treatment of both simple and complex sports-related injuries. For ease of use, the book is divided into the various anatomical sections: the forefoot, the midfoot, the hindfoot, the ankle, tendon disorders, and orthotics and braces - each enhanced by rehabilitation procedures and algorithms. It enables the physician to formulate a treatment plan and compare the various surgical and non-surgical options for a variety of injuries including: stress and other fractures, ankle instability, ruptures, sprain, ligament injuries, tendonitis, lesions, and neuropathies. The text is supported by copious illustrations, including 100 line drawings, 99 operative photos and a full-colour 4-page insert.

Treatment of Injuries of the Peripheral Spinal Nerves (Classic Reprint) Jul 25 2020 Excerpt from Treatment of Injuries of the Peripheral Spinal Nerves IN the following monograph an attempt is made to place at the disposal of the

general surgeon, who may be called on to deal with an occasional case of peripheral nerve injury, the experience which has been gathered from the exceptionally abundant material provided by the Great War. It is hoped to map out for the surgeon who has no special experience of the subject those paths which will lead to a successful result for himself and his patient and to help him to avoid those pitfalls which have entrapped most workers at first, before they learned to look out for them. Etiology and Treatment of Overuse Injuries of the Tibia Dec 18 2019

1. Title: Etiology and treatment of overuse injuries of the tibia. 2. Clinical Bottom Line: Not everyone sustains an overuse injury, but there are a consistent percentage of people who do. Many studies have looked at a variety of intrinsic and extrinsic factors leading to an overuse injury. We wanted to know if there are consistent biomechanical risk factors that can be accounted for, and if so, could they be used as a part of a screening tool and also treated in order to prevent injury. 3. Clinical Scenario: In an article written by Belinda R. Beck, current conservative management of overuse injuries involves rest from a range of 1 to 16 weeks, some clinicians choose to cast and approximately 48.8% of clinicians surveyed recommend stretching the triceps surae. These are the most common approaches that have been used in the clinic for treating overuse injuries. We would like to know

how effective these are and what are some of the ideal treatment/preventative measures for those found with an identified biomechanical risk factor. 4. Our Clinically Answerable Questions: a. PICO#1 i. Population: The populations we are focusing on are athletes or people experiencing an increase in physical training. ii. Intervention: A significant period of repetitive weight bearing activity. iii. Comparison: biomechanical factors of those who developed a stress injury of the tibia compared to those who did not. iv. Outcome: Biomechanical assessments of the lower extremities. b. PICO#2 i. Population: The populations we are focusing on are athletes or people experiencing an increase in physical training. ii. Intervention: We are looking at orthotics, insoles, stretching, and strengthening as treatment options. iii. Comparison: No preventative measures. iv. Outcome: We are looking at the incidence of injury among our populations.
